Let's have a look at the **Live filters and text** and **Live Adjustments** will let you add, access and edit Photoshop layers without the need to create artwork or make any other steps. As discussed above, Photoshop Live Layers are also a process of **Filters**. As filters are all living, each state can be edited independently. Whereas a normal layer has a set of unique and distinct characteristics, a living filter is a state of a current filter, and allows the user to see how the filter is affecting a document. You can access and modify layers independently with the **Live filters**. To modify the live filter, simply double-click the layer name, previous or explore all the live filters related to that layer. Modifying a filter removes any filters applied to the document, and provides access for users to see how different states affect or look like. In the new version of Photoshop, layers now include a set of live filters. You can quickly access and control these filters by right-clicking on any layer name and selecting **Explore live filters**. To access the live filters that are available, select the **Edit live filters** tab from the right side panel. The **Explore live filters** section contains a drop-down box that will show you the available filters for the current layer, and provides you an option to create a new filter. If you select **Create**, a filter canvas will be shown below your current layer, with all the available filter options. With the new **Create** option, filter preview changes live as you make changes to the panel.
